Please note that the content of this book primarily consists of articles available from Wikipedia or other free sources online. Occupational Hygiene is generally defined as the art and science dedicated to the Anticipation, Recognition, Evaluation, Communication and Control of environmental stressors in, or arising from, the work place that may result in injury, illness, impairment, or affect the well being of workers and members of the community. These stressors are normally divided into the categories Biological, Chemical, physical, Ergonomic and Psychosocial. The British Occupational Hygiene Society (BOHS) define that Occupational Hygiene is about the prevention of ill-health from work, through recognising, evaluating and controlling the risks. The International Occupational Hygiene Association (IOHA) refers to Occupational Hygiene as the discipline of anticipating, recognising, evaluating and controlling health hazards in the working environment with the objective of protecting worker health and well-being and safeguarding the community at large.
